

Amoeba Sisters Video Recap: Biological Levels

Writing Exercise

1. View the cartoon image at right. You've been volunteering in a kindergarten classroom, and one of the children asks about the biological levels of organization that you are studying (in random order): **tissues, cells, organ systems, organs**. From smallest to largest, explain these levels as they relate to the cartoon image below. Remember, it is unlikely the children in this kindergarten class have taken an advanced science course yet so keep this in mind when making your explanation.

Amoeba Sisters Video Recap: Biological Levels

Make Your Own Biotic vs. Abiotic Graphic!

2. As we move into larger biological levels, it's important to understand the vocabulary terms: **abiotic** and **biotic**. Design a Biotic vs. Abiotic Factors graphic (with examples) that your classmates could use to tell the difference between the two.

*Select a biome that you will use in #7 and write that biome on the line. Then, give a description of potential biotic and/or abiotic factors in each level based on the biome you selected. **If the level includes abiotic factors, circle the level!***

3. Organism (Individual)

4. Population

5. Community

6. Ecosystem

7. Biome (Selected biome: _____)

8. Biosphere

9. Biology encompasses all levels of biological organization, but scientists can specialize in studying a certain level. For example, explain which specific level(s) a scientist might focus on if investigating genetic links to certain types of cancer?
