

Amoeba Sisters Video Recap: Biomagnification

1. **Diagram it!** Illustrate the organisms listed above the labels below. Draw in arrows to show the direction of energy flow and fill in the consumer labels. You will use this diagram to answer several questions that follow.

5 Insects

2 Lizards

1 Predatory Bird

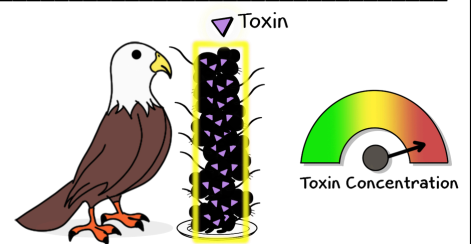

(Primary Consumer)

(_____ Consumer)

(_____ Consumer)

2. Consider a toxin (with the ability to **bioaccumulate**) used on the insects. If the insects are exposed to this toxin, explain how this toxin can also reach lizards and predatory birds based on the diagram you made from #1.

3. Which consumer level from question #1 would you predict to have the highest concentration of toxin? Why?

4. The video mentions that many toxins, such as many pesticides, do not necessarily stay isolated to the area where they are intended to be placed. Explain.

Apply It!

[illegible]

6. Your Ideas: Based on your understanding of **biomagnification**, what are some questions that one may want to consider if preparing to release a new pesticide?
